

PHRASE-BASED TEXT SEARCHING

Abstract

5           The computer-implemented process includes establishing  
a database containing data corresponding to a probability  
that words occur together in text, receiving a phrase  
comprised of the words, retrieving the data for the words  
from the database in response to receiving the phrase, and  
10       determining, based on the data, whether to perform a text  
search for the phrase as a whole or for the words  
individually.
